Then there exists a finitely generated group whose Cayley graph contains a (coarse) copy of  $\sqcup G_i$ .

**The cross-bred Monster** There exists a finitely generated group that is both Tarski monster and Gromov monster.

 $G = \langle X \mid R \rangle$  is a group presentation,  $R = R^{-1}$  closed under cyclic shifts

◆□▶ ◆□▶ ◆ □▶ ★ □▶ = □ ● の < @

 $G = \langle X | R \rangle$  is a group presentation,  $R = R^{-1}$  closed under cyclic shifts Let X be its presentation complex. Its universal cover is the Cayley 2-complex.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三回 ● のへで

 $G = \langle X \mid R \rangle$  is a group presentation,  $R = R^{-1}$  closed under cyclic shifts Let X be its presentation complex. Its universal cover is the Cayley 2-complex. Consider a map from the disk  $D^2$  to  $\tilde{X}$ . The image of  $\partial D^2$  is a loop labeled by a word  $w =_G 1$ . Pulling back the Cayley 1-complex, we get a labeled tessellation of  $D^2$  into cells  $C_i$ ,  $\partial C_i$  is labeled by a word in R. It is a van Kampen diagram for w.

Cartan-Hadamard, Coulon's theorem

Theorem (Remi Coulon)

## Cartan-Hadamard, Coulon's theorem

#### Theorem (Remi Coulon)

Let  $\delta \ge 0$ . Let  $\sigma > 10^{10}\delta$ . Let X be a simply-connected length space. If every ball of radius  $\sigma$  is  $\delta$  hyperbolic, then X is (globally) 500 $\delta$ -hyperbolic.

Produce a new group G<sub>2</sub>. Make sure that G<sub>2</sub> is hyperbolic.

Proceed by induction.

The inductive limit  $\varinjlim G_i = G$  is a Tarski monster.

Use of small cancellation. Gromov monster.

▲□▶ ▲圖▶ ▲圖▶ ▲圖▶ ▲□▶

Use of small cancellation. Gromov monster.

#### To construct a Gromov monster,

- Start with the free group  $F_k = \langle x_1, ..., x_k \rangle$ .
- Pick the first graph in the expander sequence,  $G_1$ .
- Consider a random labeling of edges of  $G_1$  by letters  $x_1^{\pm 1}, ..., x_k^{\pm 1}$ .
- For every loop p of a generating set of the fundamental group  $\pi_1(G_1)$  impose relation label(p) = 1.
- Make sure that the resulting group is hyperbolic (that is true with probability > 0).

Proceed by induction, choosing the next graph from the expanding sequence with large enough girth. Use of small cancellation. Gromov monster.

To construct a Gromov monster,

- Start with the free group  $F_k = \langle x_1, ..., x_k \rangle$ .
- Pick the first graph in the expander sequence,  $G_1$ .
- Consider a random labeling of edges of  $G_1$  by letters  $x_1^{\pm 1}, ..., x_k^{\pm 1}$ .
- For every loop p of a generating set of the fundamental group  $\pi_1(G_1)$  impose relation label(p) = 1.
- Make sure that the resulting group is hyperbolic (that is true with probability > 0).
- Proceed by induction, choosing the next graph from the expanding sequence with large enough girth.

The inductive limit  $\varinjlim G_i$  is a Gromov monster. Note that the presentation is recursive.

Use of small cancellaion. The cross-bred monster.

To produce a cross-bred monster, alternate steps of the two recipes.

 $rq_1q_2q_3$ 

Let  $\Gamma = \langle X \mid R \rangle$ , *R* recursive. Here is a computation of a Turing machine accepting a word  $r \in R$ . We are going to turn it into a tesselated disc.

 $rq_1q_2q_3$ 

*r* is accepted if and only if  $rq_1q_2q_3$  is conjugated to  $q_1^0q_2^0q_3^0$ . The conjugator is the history of computation.

The proof of the Higman embedding theorem. 2 We need to hide the history. Apply the Davis' idea. Consecutive petals of the flower are mirror images of each other, glued by *k*-strips.

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

We need to hide the history. Apply the Davis' idea. Consecutive petals of the flower are mirror images of each other, glued by *k*-strips. Add the heart of the flower, called the hub, to the set of relations. Note that 4 = 12 here for the small cancellation reasons.  $rq_1q_2q_3$ 

The word  $(r^{(1)}q_1^{(1)}q_2^{(1)}q_3^{(1)})(r^{(2)}q_1^{(2)}q_2^{(2)}q_3^{(2)})...(r^{(12)}q_1^{(12)}q_2^{(12)}q_3^{(12)})$ is 1 in the group if an only if *r* is accepted by the Turing machine.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三回 ● ○○

The word  $(q_1^{(1)}q_2^{(1)}q_3^{(1)})(r^{(2)}q_1^{(2)}q_2^{(2)}q_3^{(2)})...(\overline{r^{(12)}q_1^{(12)}q_2^{(12)}q_3^{(12)}})$  is 1 in the group G given by all the relations in two flowers if an only if r is accepted by the Turing machine.

Thus is r is accepted by the Turing machine (i.e. is the defining relator of a group  $\Gamma$ ), then  $r = r^{(1)} = 1$  in the constructed group G.

Thus is r is accepted by the Turing machine (i.e. is the defining relator of a group  $\Gamma$ ), then  $r = r^{(1)} = 1$  in the constructed group G. Hence there is a homomorphism from  $\Gamma$  to G.

Thus is r is accepted by the Turing machine (i.e. is the defining relator of a group  $\Gamma$ ), then  $r = r^{(1)} = 1$  in the constructed group G. Hence there is a homomorphism from  $\Gamma$  to G. This homomorphism is injective.

Thus is r is accepted by the Turing machine (i.e. is the defining relator of a group  $\Gamma$ ), then  $r = r^{(1)} = 1$  in the constructed group G. Hence there is a homomorphism from  $\Gamma$  to G. This homomorphism is injective.

#### **Problem.** The group *G* is almost never aspherical

Indeed, the letters of r commute with  $\theta$ . Consider the closed cylinder with top and bottom circle containing the diagram for r = 1 in G, the side tesselated by the commutativity cells. It is a map from the sphere  $S^2$  into the representation complex.

## The real embedding

Replace a sunflower with a rose:

Take any map  $\phi: S^2 \to G$ , homotop it to  $\phi': S^2 \to \Gamma$ .

Take any map  $\phi: S^2 \to G$ , homotop it to  $\phi': S^2 \to \Gamma$ . More concretely, consider any diagram on  $S^2$  over *G*.Look for hubs. They are connected by *k*-strips.

Take any map  $\phi: S^2 \to G$ , homotop it to  $\phi': S^2 \to \Gamma$ . More concretely, consider any diagram on  $S^2$  over G.Look for hubs. They are connected by k-strips.

Take any map  $\phi: S^2 \to G$ , homotop it to  $\phi': S^2 \to \Gamma$ . More concretely, consider any diagram on  $S^2$  over G.Look for hubs. They are connected by k-strips. You get a graph on  $S^2$  of degree 12. There must be two hubs connected by two consecutive k-strips.

Take any map  $\phi: S^2 \to G$ , homotop it to  $\phi': S^2 \to \Gamma$ . More concretely, consider any diagram on  $S^2$  over G.Look for hubs. They are connected by k-strips. You get a graph on  $S^2$  of degree 12. There must be two hubs connected by two consecutive k-strips. The diagram between these two strips is "standard" (corresponds to some computation).

Take any map  $\phi: S^2 \to G$ , homotop it to  $\phi': S^2 \to \Gamma$ . More concretely, consider any diagram on  $S^2$  over G.Look for hubs. They are connected by k-strips. You get a graph on  $S^2$  of degree 12. There must be two hubs connected by two consecutive k-strips. The diagram between these two strips is "standard" (corresponds to some computation). Complete it to a composition of a rose and a sunflower with 11 petals tessellating a  $\Gamma$ -cell.

Take any map  $\phi: S^2 \to G$ , homotop it to  $\phi': S^2 \to \Gamma$ . More concretely, consider any diagram on  $S^2$  over G.Look for hubs. They are connected by k-strips. You get a graph on  $S^2$  of degree 12. There must be two hubs connected by two consecutive k-strips. The diagram between these two strips is "standard" (corresponds to some computation). Complete it to a composition of a rose and a sunflower with 11 petals tessellating a  $\Gamma$ -cell. Now you need to consider diagrams with extra cells,  $\Gamma$ -cells. If there are still hubs, proceed as before. If not, prove that there are no G-cells left as well.
