In several mathematical theories one encounters objects defined as **inverse limits**. Typically this happens in **sheaf theory**, where the global sections of a sheaf are inverse limit of the local ones. Analogous structures actually largely appear in several theories such as **topos theory**, **linear algebra**, **algebraic geometry**, **functional analysis** and many others. Limits contain crucial information of the original systems and it is interesting to study what properties are lost in the limit process.

One of these is the exactness of short exact sequences.

In several mathematical theories one encounters objects defined as **inverse limits**. Typically this happens in **sheaf theory**, where the global sections of a sheaf are inverse limit of the local ones. Analogous structures actually largely appear in several theories such as **topos theory**, **linear algebra**, **algebraic geometry**, **functional analysis** and many others. Limits contain crucial information of the original systems and it is interesting to study what properties are lost in the limit process.

One of these is *the exactness of short exact sequences*. The importance of these properties is illustrated again by the example of sheaves theory, where there is an entire cohomology theory devoted to *"measure"* the default of exactness of the global section functor.

In several mathematical theories one encounters objects defined as **inverse limits**. Typically this happens in **sheaf theory**, where the global sections of a sheaf are inverse limit of the local ones. Analogous structures actually largely appear in several theories such as **topos theory**, **linear algebra**, **algebraic geometry**, **functional analysis** and many others. Limits contain crucial information of the original systems and it is interesting to study what properties are lost in the limit process.

One of these is *the exactness of short exact sequences*. The importance of these properties is illustrated again by the example of sheaves theory, where there is an entire cohomology theory devoted to *"measure"* the default of exactness of the global section functor.

More specifically, we are interested here in a precise criterion, originally due to Mittag-Leffler [Bou07, II.19, *N*<sup>o</sup>5, Exemple], ensuring that exactness of short exact sequences is preserved when passing to the limit.

Let *R* be a ring with unit element.

Let *R* be a ring with unit element.

- A poset (*I*, ≤) is *directed* if for all *i*, *j* ∈ *I* there exists *k* ∈ *I* such that *k* ≥ *i* and *k* ≥ *j*.
- For all  $i \in I$  we set

$$\Lambda(i) = \{j \in I, j \le i\}, \tag{1}$$

$$V(i) = \{j \in I, j \ge i\}$$
. (2)

• A directed subset  $I' \subset I$  is *cofinal* if for every  $i \in I$  there exists  $i' \in I'$  such that  $i' \geq i$ .

(4) The (b)

Let R be a ring with unit element.

- A poset (*I*, ≤) is *directed* if for all *i*, *j* ∈ *I* there exists *k* ∈ *I* such that *k* ≥ *i* and *k* ≥ *j*.
- For all  $i \in I$  we set

$$\Lambda(i) = \{j \in I, j \le i\}, \qquad (1)$$

$$V(i) = \{j \in I, j \ge i\}$$
. (2)

- A directed subset  $I' \subset I$  is *cofinal* if for every  $i \in I$  there exists  $i' \in I'$  such that  $i' \geq i$ .
- An *inverse system* indexed on *I* is a collection of left *R*-modules (*S<sub>i</sub>*)<sub>*i*∈*I*</sub> indexed by *I*, together with a family of maps

$$(\rho_{i,j}^{\mathcal{S}}: \mathcal{S}_i \to \mathcal{S}_j)_{(i,j) \in l^2, i \geq j}$$

such that

- for all  $i \in I$  the map  $\rho_{i,i}^{S}$  is the identity map of  $S_i$ ,
- for all  $i, j, k \in I$  such that  $i \ge j \ge k$  one has  $\rho_{i,k}^S \circ \rho_{i,j}^S = \rho_{i,k}^S$ .

For any two systems S = (S<sub>i</sub>, ρ<sup>S</sup><sub>i,j</sub>) and T = (T<sub>i</sub>, ρ<sup>T</sup><sub>i,j</sub>) indexed on the same *I* a morphism f : S → T is a collection

$$(f_i: S_i \to T_i)_{i \in I}$$

of *R*-linear maps such that for every  $i \ge j$  the following diagram commutes

$$S_{i} \xrightarrow{f_{i}} T_{i}$$

$$\downarrow^{\rho_{i,j}^{S}} \qquad \downarrow^{\rho_{i,j}^{T}}$$

$$S_{j} \xrightarrow{f_{j}} T_{j}$$
(3)

For any two systems S = (S<sub>i</sub>, ρ<sup>S</sup><sub>i,j</sub>) and T = (T<sub>i</sub>, ρ<sup>T</sup><sub>i,j</sub>) indexed on the same *I* a morphism f : S → T is a collection

$$(f_i: S_i \to T_i)_{i \in I}$$

of *R*-linear maps such that for every  $i \ge j$  the following diagram commutes

$$\begin{array}{ccc} S_{i} & \stackrel{f_{i}}{\longrightarrow} & T_{i} \\ & & & & \downarrow^{\rho_{i,j}^{S}} & & \downarrow^{\rho_{i,j}^{T}} \\ S_{j} & \stackrel{f_{j}}{\longrightarrow} & T_{j} \end{array}$$
 (3)

An inverse system (S<sub>i</sub>, ρ<sup>S</sup><sub>i,j</sub>) is nothing but a *functor* from the category (I, ≤) to the category R – Mod and a morphism f : S → T is just a morphism of functors.

For any two systems S = (S<sub>i</sub>, ρ<sup>S</sup><sub>i,j</sub>) and T = (T<sub>i</sub>, ρ<sup>T</sup><sub>i,j</sub>) indexed on the same *I* a morphism f : S → T is a collection

$$(f_i: S_i \to T_i)_{i \in I}$$

of *R*-linear maps such that for every  $i \ge j$  the following diagram commutes

$$\begin{array}{ccc} S_i & \stackrel{f_i}{\longrightarrow} & T_i \\ & & & \downarrow^{\rho_{i,j}^S} & & \downarrow^{\rho_{i,j}^T} \\ S_j & \stackrel{f_j}{\longrightarrow} & T_j \end{array}$$
 (3)

- An inverse system (S<sub>i</sub>, ρ<sup>S</sup><sub>i,j</sub>) is nothing but a *functor* from the category (I, ≤) to the category R Mod and a morphism f : S → T is just a morphism of functors.
- Similarly, we can define the category of *inverse systems of sets* as functors from *I* to the category of sets.

## • Let $R - Mod^{I}$ be the category of inverse systems indexed on I.

For every  $i \ge j$  we have commutative triangles

• For every morphism of inverse systems  $S \to T$  we have a morphism  $\varprojlim_{i \in I} S_i \to \varprojlim_{i \in I} T_i$ .

• The inverse limit is a functor

$$\varprojlim_{i \in I} : R - Mod^{I} \longrightarrow R - Mod$$

2

イロト イヨト イヨト イヨト

• The inverse limit is a functor

$$\varprojlim_{i \in I} : R - Mod^{I} \longrightarrow R - Mod$$

If

$$0 
ightarrow (A_i) 
ightarrow (B_i) 
ightarrow (C_i) 
ightarrow 0$$

is an exact sequence of inverse systems in  $R - Mod^{l}$ , then

$$0 \to \varprojlim_{i \in I} A_i \to \varprojlim_{i \in I} B_i \to \varprojlim_{i \in I} C_i$$

is exact in R - Mod.

A The built

The inverse limit is a functor

$$\varprojlim_{i \in I} : R - Mod^{I} \longrightarrow R - Mod$$

If

$$0 \to (\textbf{\textit{A}}_i) \to (\textbf{\textit{B}}_i) \to (\textbf{\textit{C}}_i) \to 0$$

is an exact sequence of inverse systems in  $R - Mod^{\prime}$ , then

$$0 \to \varprojlim_{i \in I} A_i \to \varprojlim_{i \in I} B_i \to \varprojlim_{i \in I} C_i$$

is exact in R - Mod. In other words, the functor  $\lim_{i \in I}$  is **left exact**.

4 E 5

• The functor  $\lim_{i \in I} : R - Mod^{I} \rightarrow R - Mod$  can be derived. We call

$$\varprojlim_{i\in I}^{(n)}: R-\mathit{Mod}^{I} \to R-\mathit{Mod}$$

the n-th derived functors.

• The functor  $\lim_{i \in I} : R - Mod^{I} \to R - Mod$  can be derived. We call

$$\varprojlim_{i \in I}^{(n)} : \boldsymbol{R} - \boldsymbol{Mod}^{I} \rightarrow \boldsymbol{R} - \boldsymbol{Mod}^{I}$$

the n-th derived functors.

For every short exact sequence 0 → (A<sub>i</sub>) → (B<sub>i</sub>) → (C<sub>i</sub>) → 0 of systems in R – Mod<sup>I</sup> we have a *long exact sequence* in R – Mod

$$0 \quad \rightarrow \quad \varprojlim_{i \in I} A_i \rightarrow \varprojlim_{i \in I} B_i \rightarrow \varprojlim_{i \in I} C_i \stackrel{\delta_1}{\rightarrow}$$

• The functor  $\lim_{i \in I} : R - Mod^{I} \to R - Mod$  can be derived. We call

$$\varprojlim_{i\in I}^{(n)}: \boldsymbol{R}-\boldsymbol{M}\boldsymbol{o}\boldsymbol{d}^{I} \rightarrow \boldsymbol{R}-\boldsymbol{M}\boldsymbol{o}\boldsymbol{d}^{I}$$

the n-th derived functors.

For every short exact sequence 0 → (A<sub>i</sub>) → (B<sub>i</sub>) → (C<sub>i</sub>) → 0 of systems in R – Mod<sup>I</sup> we have a *long exact sequence* in R – Mod

$$0 \rightarrow \varprojlim_{i \in I} A_i \rightarrow \varprojlim_{i \in I} B_i \rightarrow \varprojlim_{i \in I} C_i \xrightarrow{\delta_1}$$
$$\stackrel{\delta_1}{\rightarrow} \varprojlim_{i \in I} {}^{(1)}A_i \rightarrow \varprojlim_{i \in I} {}^{(1)}B_i \rightarrow \varprojlim_{i \in I} {}^{(1)}C_i \xrightarrow{\delta_2}$$

Andrea Pulita (Université Grenoble Alpes)

• The functor  $\lim_{i \in I} : R - Mod^{I} \to R - Mod$  can be derived. We call

$$\varprojlim_{i \in I}^{(n)} : \boldsymbol{R} - \boldsymbol{Mod}^{I} \rightarrow \boldsymbol{R} - \boldsymbol{Mod}$$

the n-th derived functors.

For every short exact sequence 0 → (A<sub>i</sub>) → (B<sub>i</sub>) → (C<sub>i</sub>) → 0 of systems in R – Mod<sup>I</sup> we have a *long exact sequence* in R – Mod

$$0 \rightarrow \varprojlim_{i \in I} A_{i} \rightarrow \varprojlim_{i \in I} B_{i} \rightarrow \varprojlim_{i \in I} C_{i} \xrightarrow{\delta_{1}}$$

$$\stackrel{\delta_{1}}{\rightarrow} \varprojlim_{i \in I} (^{1})A_{i} \rightarrow \varprojlim_{i \in I} (^{1})B_{i} \rightarrow \varprojlim_{i \in I} (^{1})C_{i} \xrightarrow{\delta_{2}}$$

$$\stackrel{\delta_{2}}{\rightarrow} \varprojlim_{i \in I} (^{2})A_{i} \rightarrow \varprojlim_{i \in I} (^{2})B_{i} \rightarrow \varprojlim_{i \in I} (^{2})C_{i} \xrightarrow{\delta_{3}} \cdots$$

#### Theorem 1. (Classical Mittag-Leffler)

Let *I* be a directed poset. Let  $0 \rightarrow (A_i) \rightarrow (B_i) \rightarrow (C_i) \rightarrow 0$  be an exact sequence of inverse systems in R – *Mod*. Assume that

- There exists a cofinal subset of / which is at most countable;
- 2 For all  $i \in I$ , there exists  $j \ge i$  such that for all  $r \ge j$  one has

$$\rho_{j,i}^{\mathcal{A}}(\mathcal{A}_j) = \rho_{r,i}^{\mathcal{A}}(\mathcal{A}_r) . \tag{4}$$

Then, the first derived functor  $\lim_{i \in I} (1)$  of  $\lim_{i \in I} (1)$  vanishes at  $(A_i)_i$ :

$$\varprojlim_{i\in I}^{(1)}A_i=0$$

In particular, the short sequence of limits

$$0 \longrightarrow \varprojlim_{i \in I} A_i \longrightarrow \varprojlim_{i \in I} B_i \longrightarrow \varprojlim_{i \in I} C_i \longrightarrow 0$$

is exact.

#### Theorem 1. (Classical Mittag-Leffler)

Let *I* be a directed poset. Let  $0 \rightarrow (A_i) \rightarrow (B_i) \rightarrow (C_i) \rightarrow 0$  be an exact sequence of inverse systems in R – *Mod*. Assume that

- There exists a cofinal subset of / which is at most countable;
- 2 For all  $i \in I$ , there exists  $j \ge i$  such that for all  $r \ge j$  one has

$$\rho_{j,i}^{\mathcal{A}}(\mathcal{A}_j) = \rho_{r,i}^{\mathcal{A}}(\mathcal{A}_r) . \tag{4}$$

Then, the first derived functor  $\lim_{i \in I} (1)$  of  $\lim_{i \in I} (1)$  vanishes at  $(A_i)_i$ :

$$\varprojlim_{i\in I}^{(1)}A_i=0$$

In particular, the short sequence of limits

$$0 \longrightarrow \varprojlim_{i \in I} A_i \longrightarrow \varprojlim_{i \in I} B_i \longrightarrow \varprojlim_{i \in I} C_i \longrightarrow 0$$

is exact.

#### Aim : we want to relax the countability assumption, $(1)_{E}$ ,

Oxford, 10th of March 2020

11/33

#### First considerations

• Condition 2 is called Mittag-Leffler condition.

**A** ►

#### First considerations

 Condition 2 is called Mittag-Leffler condition. It is not a necessary and sufficient condition for the vanishing of  $\lim_{i \in I}^{(1)} A_i$ .

a 🕨
- Condition 2 is called Mittag-Leffler condition. It is *not a necessary* and sufficient condition for the vanishing of lim<sup>(1)</sup><sub>i∈I</sub> A<sub>i</sub>.
- Assumption 1 says that there exists a map τ : N → I of posets whose image is a cofinal subset of I.

- Condition 2 is called Mittag-Leffler condition. It is *not a necessary* and sufficient condition for the vanishing of lim<sup>(1)</sup><sub>i∈I</sub> A<sub>i</sub>.
- Assumption 1 says that there exists a map τ : N → I of posets whose image is a cofinal subset of I. This is a strong condition because, by a result of Mitchell (cf. [Mit73, Theorem B]), it implies that for all inverse systems (Q<sub>i</sub>)<sub>i∈I</sub> of R-modules and for all n ≥ 0, we have a canonical isomorphism

$$\varprojlim_{i \in I} {}^{(n)}Q_i \cong \varprojlim_{i \in \mathbb{N}} {}^{(n)}Q_i$$

- Condition 2 is called Mittag-Leffler condition. It is *not a necessary* and sufficient condition for the vanishing of lim<sup>(1)</sup><sub>i∈I</sub> A<sub>i</sub>.
- Assumption 1 says that there exists a map τ : N → I of posets whose image is a *cofinal* subset of I. *This is a strong condition* because, by a result of Mitchell (cf. [Mit73, Theorem B]), it implies that for all inverse systems (Q<sub>i</sub>)<sub>i∈I</sub> of R-modules and for all n ≥ 0, we have a canonical isomorphism

$$\varprojlim_{i\in I} {}^{(n)}Q_i \cong \varprojlim_{i\in\mathbb{N}} {}^{(n)}Q_i$$

Hence, from a cohomological point of view, *inverse systems over* I are *indistinguishable from those over*  $\mathbb{N}$ .

- Condition 2 is called Mittag-Leffler condition. It is *not a necessary* and sufficient condition for the vanishing of lim<sup>(1)</sup><sub>i∈I</sub> A<sub>i</sub>.
- Assumption 1 says that there exists a map τ : N → I of posets whose image is a cofinal subset of I. This is a strong condition because, by a result of Mitchell (cf. [Mit73, Theorem B]), it implies that for all inverse systems (Q<sub>i</sub>)<sub>i∈I</sub> of R-modules and for all n ≥ 0, we have a canonical isomorphism

$$\varprojlim_{i\in I} {}^{(n)}Q_i \cong \varprojlim_{i\in\mathbb{N}} {}^{(n)}Q_i$$

Hence, from a cohomological point of view, *inverse systems over* I *are indistinguishable from those over*  $\mathbb{N}$ .

In particular, the claim implies lim<sub>i∈I</sub><sup>(n)</sup> A<sub>i</sub> = 0, for all integer n ≥ 0, because this is true for I = N.

• Let A, B, C be the limits. For all  $i \ge j$  we have a diagram

In this situation, any a direct set-theoretical attempt of the proof of Mittag-Leffler theorem based on the lifting non vanishing of the system  $(S_i)_{i \in I}$  is unhelpful, as one can easily see.

We provide here two generalizations of Theorem 1 to the case of an uncountable / without countable cofinal subsets that only involve **a** *finiteness condition on the transition maps* of the system  $(A_i)_{i \in I}$  and no conditions on / nor on the objects.

18/33

#### Theorem 2. (pull-back)

Let  $(\rho_{i,j}^A : A_i \to A_j)_{i,j \in I}$  be an inverse systems of left *R*-modules indexed on *I*. Assume that there exists another directed partially ordered set  $(J, \leq)$  and an inverse system of *R*-modules  $(\rho_{i,j}^S : S_i \to S_j)_{i,j \in J}$  s.t.

- There exist cofinal directed subsets I' ⊆ I and J' ⊆ J and a surjective map p : I' → J' preserving the order relation;
- ② There exists a system of *R*-linear isomorphisms  $(\psi_i : A_i \xrightarrow{\sim} S_{p(i)})_{i \in I'}$  such that for all *i*, *j* ∈ *I'* with *i* ≥ *j* one has a commutative diagram

$$\begin{array}{c|c} A_{i} & \xrightarrow{\psi_{i}} & S_{\mathcal{P}(i)} \\ \rho_{i,j}^{A} & \bigcirc & \bigvee_{p_{\mathcal{P}(i),\mathcal{P}(j)}} \\ A_{j} & \xrightarrow{\psi_{j}} & S_{\mathcal{P}(j)} \end{array}$$

Then, for all integer  $n \ge 0$ , we have a canonical isomorphism

$$\varprojlim_{i\in I}{}^{(n)}A_i \xrightarrow{\sim} \varprojlim_{j\in J}{}^{(n)}S_j.$$

In particular, if *J* and  $(S_j)_{j \in J}$  satisfy Theorem 1, then  $\varprojlim_{i \in I}^{(n)} A_i = 0$  for all  $n \ge 1$ .

Theorem 2 implies Theorem 1. Indeed, if *I*' ⊆ *I* is a countable cofinal directed subset in Theorem 1, then *I*' = *J*, *S* = *A*, ψ = *id* satisfies the assumptions of Theorem 2.

- Theorem 2 implies Theorem 1. Indeed, if  $I' \subseteq I$  is a countable cofinal directed subset in Theorem 1, then I' = J, S = A,  $\psi = id$  satisfies the assumptions of Theorem 2.
- In Theorem 2, *I* is allowed to be arbitrarily large, while in Theorem 1, *I* is artificially forced to be small.

- Theorem 2 implies Theorem 1. Indeed, if I' ⊆ I is a countable cofinal directed subset in Theorem 1, then I' = J, S = A, ψ = id satisfies the assumptions of Theorem 2.
- In Theorem 2, *I* is allowed to be arbitrarily large, while in Theorem 1, *I* is artificially forced to be small.
- It easy to show that  $\lim_{i \in I} A_i = \lim_{j \in J} S_j$ .

- Theorem 2 implies Theorem 1. Indeed, if  $I' \subseteq I$  is a countable cofinal directed subset in Theorem 1, then I' = J, S = A,  $\psi = id$  satisfies the assumptions of Theorem 2.
- In Theorem 2, *I* is allowed to be arbitrarily large, while in Theorem 1, *I* is artificially forced to be small.
- It easy to show that  $\varprojlim_{i \in I} A_i = \varprojlim_{j \in J} S_j$ . However, it seems complicate to prove that  $\varprojlim_{i \in I} {}^{(n)}A_i = \varprojlim_{j \in J} {}^{(n)}S_j$  with the techniques of Bourbaki.

- Theorem 2 implies Theorem 1. Indeed, if  $I' \subseteq I$  is a countable cofinal directed subset in Theorem 1, then I' = J, S = A,  $\psi = id$  satisfies the assumptions of Theorem 2.
- In Theorem 2, *I* is allowed to be arbitrarily large, while in Theorem 1, *I* is artificially forced to be small.
- It easy to show that  $\varprojlim_{i \in I} A_i = \varprojlim_{j \in J} S_j$ . However, it seems complicate to prove that  $\varprojlim_{i \in I} {}^{(n)}A_i = \varprojlim_{j \in J} {}^{(n)}S_j$  with the techniques of Bourbaki. This is due to the following facts :
  - inverse limits of sets indexed on an uncountable poset may be empty even with surjective transition maps;

- Theorem 2 implies Theorem 1. Indeed, if  $I' \subseteq I$  is a countable cofinal directed subset in Theorem 1, then I' = J, S = A,  $\psi = id$  satisfies the assumptions of Theorem 2.
- In Theorem 2, *I* is allowed to be arbitrarily large, while in Theorem 1, *I* is artificially forced to be small.
- It easy to show that  $\varprojlim_{i \in I} A_i = \varprojlim_{j \in J} S_j$ . However, it seems complicate to prove that  $\varprojlim_{i \in I} {}^{(n)}A_i = \varprojlim_{j \in J} {}^{(n)}S_j$  with the techniques of Bourbaki. This is due to the following facts :
  - inverse limits of sets indexed on an uncountable poset may be empty even with surjective transition maps;
  - the proof of Bourbaki provides only a LOCAL isomorphism of the systems of sets, which actually does not preserve the non vanishing of the limit.

#### Theorem 3. (Push-forward)

Let  $(\rho_{i,j}^{A} : A_{i} \rightarrow A_{j})_{i,j \in I}$  be an inverse systems of left *R*-modules indexed on *I*.

Assume that there exists a *directed* partially ordered set  $(J, \leq)$  together with an inverse system of *R*-modules  $(\rho_{i,j}^T : T_i \to T_j)_{i,j \in J}$  such that

(i) There exists cofinal directed subset  $I' \subseteq I$  and  $J' \subseteq J$  and a map  $q: J' \to I'$  preserving the order relation such that for all  $i \in I'$ , the set

$$U_i:=\{j\in J',q(j)\leq i\},$$

endowed with the partial order induced by J', satisfies at least one of the following conditions

- $U_i$  is empty;
- 2  $U_i$  has a unique maximal element r(i);
- Output is directed, it has countable cofinal directed poset J' and the system (ρ<sup>T</sup><sub>j,k</sub> : T<sub>j</sub> → T<sub>k</sub>)<sub>j,k∈J'</sub> satisfies Mittag-Leffler Theorem.

(ii) For all  $i \in I'$  there exists an *R*-linear isomorphisms  $\phi_i : A_i \xrightarrow{\sim} \varprojlim_{j \in U_i} T_j$  such that for all  $k \in I'$  with  $k \ge i$  one has a commutative diagram

where the right hand vertical arrow  $\alpha_{k,i}$  is deduced by the universal properties of the limits as  $U_i \subset U_k$ .

Then, for all integer  $n \ge 0$ , we have a canonical isomorphism

$$\lim_{i \in I} {}^{(n)}A_i \xrightarrow{\sim} \lim_{j \in J} {}^{(n)}T_j.$$
(5)

In particular, if J and  $(T_j)_{j \in J}$  satisfy Theorem 1, then  $\varprojlim_{i \in I}^{(n)} A_i = 0$  for all  $n \ge 1$ .

• Theorem 1 implies Theorem 3. Indeed, if  $I' \subseteq I$  is a countable cofinal directed subset in Theorem 1, then I' = J, T = A,  $\phi = id$  satisfies the assumptions of Theorem 3.

- Theorem 1 implies Theorem 3. Indeed, if  $I' \subseteq I$  is a countable cofinal directed subset in Theorem 1, then I' = J, T = A,  $\phi = id$  satisfies the assumptions of Theorem 3.
- Again in Theorem 3, *I* is allowed to be arbitrarily large, while in Theorem 1 *I* is artificially forced to be small.

- Theorem 1 implies Theorem 3. Indeed, if  $I' \subseteq I$  is a countable cofinal directed subset in Theorem 1, then I' = J, T = A,  $\phi = id$  satisfies the assumptions of Theorem 3.
- Again in Theorem 3, *I* is allowed to be arbitrarily large, while in Theorem 1 *I* is artificially forced to be small.
- If  $J = \mathbb{N}$ , and T satisfies Mittag-Leffler, then conditions 1, 2, 3 on  $U_i$  are automatic.

- Theorem 1 implies Theorem 3. Indeed, if  $I' \subseteq I$  is a countable cofinal directed subset in Theorem 1, then I' = J, T = A,  $\phi = id$  satisfies the assumptions of Theorem 3.
- Again in Theorem 3, *I* is allowed to be arbitrarily large, while in Theorem 1 *I* is artificially forced to be small.
- If  $J = \mathbb{N}$ , and T satisfies Mittag-Leffler, then conditions 1, 2, 3 on  $U_i$  are automatic.
- Moreover, if J = N and if we impose that the image of J in I is never contained in some Λ(i) for all i ∈ I, then 3 is impossible, while 1 and 2 are automatically verified.

- Theorem 1 implies Theorem 3. Indeed, if  $I' \subseteq I$  is a countable cofinal directed subset in Theorem 1, then I' = J, T = A,  $\phi = id$  satisfies the assumptions of Theorem 3.
- Again in Theorem 3, *I* is allowed to be arbitrarily large, while in Theorem 1 *I* is artificially forced to be small.
- If  $J = \mathbb{N}$ , and T satisfies Mittag-Leffler, then conditions 1, 2, 3 on  $U_i$  are automatic.
- Moreover, if J = N and if we impose that the image of J in I is never contained in some Λ(i) for all i ∈ I, then 3 is impossible, while 1 and 2 are automatically verified.
- Again, it is possible to prove that  $\lim_{i \in I} A_i = \lim_{j \in J} T_j$ , but the proof of Bourbaki doesn't permit to prove the equality of  $\lim_{i \in I} (n)$  for  $n \ge 1$ .

{Inverse systems of *R*-modules over *I*}  $\cong$ {Sheaves of *R*-modules over *X*(*I*)}

- In this correspondence lim<sub>i∈I</sub>(-) corresponds to the *global* section functor Γ(X(I), -) and lim<sub>i∈I</sub><sup>(n)</sup>(-) correspond to the cohomology groups H<sup>n</sup>(X(I), -).
- The above Theorems relate the cohomology of a sheaf on *X*(*J*) with that of its pull-back and its push-forward on *X*(*I*).
- These results do not have an analogous for general topological spaces as we use properties that are specific of posets.

.

Such an exact sequence always exists (it is called flabby/injective/acyclic *resolution*).

- How to compute  $H^n(X, S)$ ?
- A is an *acyclic* sheaf if it has the property that H<sup>n</sup>(X, A) = 0 for all n ≥ 1;
  - If A is *injective*, then it is acyclic;
  - If A is *flabby*, then it is acyclic.Flabby means that for every U ⊂ V opens, the *restriction* A(V) → A(U) *is surjective*.
- If 0 → S → F<sub>1</sub> → F<sub>2</sub> → ··· is a long exact sequence where F<sub>k</sub> is *flabby/injective/acyclic*, then we have a long sequence

$$0 \to S(X) \xrightarrow{f_1} F_1(X) \xrightarrow{f_2} F_2(X) \to \cdots$$

and we can compute the cohomology groups by the formula

$$H^n(X, S) = Ker(f_{n+1})/Im(f_n)$$
.

Such an exact sequence always exists (it is called flabby/injective/acyclic *resolution*). This is also a possible way to define  $H^n(X, S)$ .

#### Theorem 2

If  $I \to J$  is surjective, then for every sheaf  $S \in Sh(X(J))$  one has for all  $n \ge 0$  $H^n(X(I), S) = H^n(X(I), f^*S)$ 

$$H^n(X(J), \mathcal{S}) = H^n(X(I), f^*\mathcal{S})$$

#### Theorem 2

If  $I \to J$  is surjective, then for every sheaf  $S \in Sh(X(J))$  one has for all  $n \ge 0$  $H^n(X(J), S) = H^n(X(I), f^*S)$ 

• *f* surjective, then  $f^*S(X(I)) = S(X(J))$ ;

#### Theorem 2

If  $I \to J$  is surjective, then for every sheaf  $S \in Sh(X(J))$  one has for all  $n \ge 0$  $H^n(X(J), S) = H^n(X(I), f^*S)$ 

- f surjective, then  $f^*S(X(I)) = S(X(J))$ ;
- There is a class of sheaves called *weakly flabby* that are acyclic and *f*\* preserves weakly flabby resolutions.
